CONSTANT OF THE SAMPLE OF BIRLS LIGHTER PATION FOR THE SAMPLE OF THE SAM

1. Commarability of items patched

The transfermers appear to be well matched in every/category, except that of specialty transfermers, dry type. Specifications for steps and number of taps are not matched for this category. The weight differentials between US and Soviet types are very large (the Soviet transfermers are indicated to be heavier than their US counterparts by a factor of two or more), and the ruble-collar ratios obtained are much higher than the ratios obtained for other categories. Comparability of the specialty transference should be rechecked before the ratios shown here are accented.

2. Representativeness of the sample

Although all major categories of transformers are represented, the average sizes of US power and distribution transformers in most of the categories used in the 1954 Census of Examinatures are smaller than the average sizes for the case categories in the cargle. In the USSM, however, the average sizes for the US census categories are probably higher because the Soviet product mix is more heavily saighted with higher capacity power and distribution transformers for industrial use. In addition, in the USSM the electric power industry tends to transmit power at higher voltages than is customary in the US. Specific information about the Soviet product mix of transformers is not available.

Price increases from 1954 to 1955 in the HS may ascount for the apparent difference in average sizes of power and distribution transformers between the 1954 commus and the sample. If prices are assumed to have remained nearly the same in 1955 as in 1954 (as well as the product mix), however, it is concluded that the sizes implaced in the sample are too large to be representative of the US product mix. The following average prices were calculated from the 1954 Commus of Narusantures:

	2
· .	
\$ 2	35
\$ 7	en.
12,4	

The sizes of specialty transformers in the sample are probably more representative of the US product mix then are the power and distribution transformers. The largest single cutogory of specialty transformers in the 1954

Approved For Release 2000/08/23: CIA-RDP62S00231A000100040075-8

Census of Marafastures, fluorescent lamp bellacts, besever, averaged [2,37] per unit, indicating that exact higher priced items should be included in the shiple. The sample of current transformers is probably adequate for this perpose. We information is available on the Soviet product mix of specialty transformers.

3. Michalleneous occupante

The SIU code for transformers is X15, not 2612.

Pocknote I is not clear. Which is the low voltage rating and which the higher? The listed ratings usually indicate only that the lower voltages of both the primary and secondary windings can be tapped off. If two prices are relevant, the items should be listed as two separate transfermers.
